

The Orchards

Demonstrating growing, pruning, and harvesting

LOOK FOR:

A wide variety of apple trees, including a row of young trees specifically chosen for their cider production. Their individual attributes are tartness, sweetness, aroma, and bitterness which combine to make the best cider.

A row of six young peach trees and five pear trees.

Coddling moth traps set for monitoring the pest and timing of Integrated Pest Management (IPM) measures.

A separate section of our orchard dedicated to the growing of seven varieties of fig trees.

NOTES:

We are required by law to control for coddling moth. We use CYD-X spray which includes a virus that attacks **ONLY** the larvae of the moth.

Pruning fruit trees for optimal production and ease of harvest begins early and is continued on an annual basis.
